

KIERAN GANNON

Byram Township, NJ | (973) 525-3907 | kieran@kierangannon.net | github.com/kieran-gannon

PROFESSIONAL SUMMARY

Cybersecurity student with a working knowledge of AI/LLM fundamentals and hands-on experience in AI risk assessment and security tooling. Focused interest in AI governance, red teaming, and LLM vulnerability research. Seeking entry-level roles at the overlap of AI and security.

EDUCATION

B.S. Cybersecurity — Mount St. Mary's University

Expected December 2026

Relevant Coursework: **Network Security, Secure Systems Design & Risk Management,** Network Systems and Design, Systems Operations Management, UNIX/Windows OS

University of New Haven

Transferred May 2024

Relevant Coursework: Script Programming/Python, Intermediate Programming (C/C++), Technical Writing in Computing

PROJECTS

AI Risk Assessment — Facial Recognition Security System | *Secure Systems Design & Risk Management (Course Assignment)*

- Developed a structured risk register evaluating a nationwide AI facial recognition deployment across five risk areas including data security, regulatory compliance, algorithmic bias, and reputational impact
- Applied probability/impact matrices and defined response strategies, responsible entities, and monitoring cadences; assessed multi-state legal exposure from biometric surveillance laws
- Identified ethical risks including training data bias leading to discriminatory outcomes, and recommended diverse dataset audits and quarterly fairness reviews by an AI development team

AI Nmap Analyzer | Python, Ollama, Nmap | github.com/kieran-gannon/ai-nmap-analyzer

- Built a conversational AI security agent using a locally hosted LLM (Gemma via Ollama) with session memory, enabling iterative natural language network reconnaissance via Nmap
- Implemented a two-stage LLM pipeline for command generation and output analysis, with security controls including command validation, privilege escalation detection, and mandatory user confirmation
- Designed with local-only LLM inference (no cloud API calls) to ensure sensitive network topology data never leaves the user's machine

SKILLS

Cybersecurity

- Vulnerability assessment, risk management, secure systems design, network security, UNIX/Windows environments

AI & LLM

- Local model deployment (Ollama, MLX), prompt engineering, NIST AI RMF, probability/impact analysis, agentic workflows; familiar with LLM security risks including prompt injection and adversarial inputs

Programming

- Python scripting and automation; C/C++ fundamentals

EXPERIENCE

Seasonal Maintenance — NJ State Park Service, Waterloo Village

2020–2026

- Maintained historic buildings and park grounds in small teams, managing competing priorities with minimal supervision across a six-year tenure
